

cocotb path complete

Mapping cocotb onto UVM roles, then self-check patterns, wave literacy, and one offline cocotb run

What you can do now

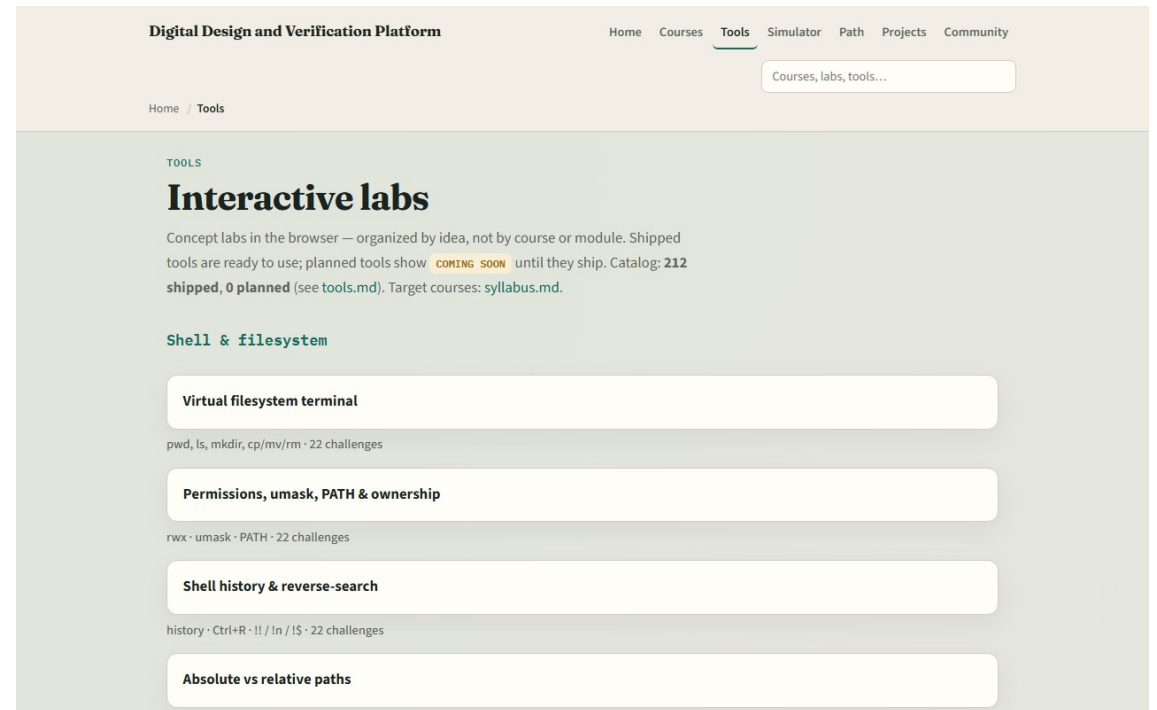

- You can sketch a Python async testbench and explain how awaits and triggers pace
- Map cocotb pieces onto SystemVerilog UVM roles in your own words
- You have run, or rehearsed, at least one real offline example with a simulator
- That literacy is what pyuvvm methodology and later protocol work expect

Close the track gaps

- If you mainly waited on browser labs, finish module ten offline, venv, make
- Waveform reading
- Either track works for self-study; both together stick best before you move on
- Remember: browser tools are literacy sketches, not a substitute for a live cocotb run

The tools you practiced

- Here is the tools index again, the same shelf of Python async, cocotb
- You do not need to re-clear every challenge
- Use it as a map

Next

- Complete the quiz for this part
- Multi-agent ideas, building on the cocotb habits you just finished

Your turn

- Review the wrap checklist in the module README
- Can say how cocotb fits before pyuvvm methodology
- When you are ready, take the short quiz, then open learn pyuvvm on the syllabus
